

Hello Hiring Manager,

I'm a senior full-stack developer and systems builder with 30+ years of hands-on experience designing, building, and deploying production web platforms—especially PHP/JavaScript applications backed by MySQL and hosted on NGINX/Linux environments. I'm reaching out because your role aligns closely with how I work: shipping real products, improving reliability and performance, and building systems that are maintainable long-term.

In recent projects, I've architected and delivered full-stack platforms end-to-end—intake-to-delivery workflows, automation tooling, and content systems—focusing on clean UX, stable backends, and practical DevOps. I'm comfortable owning the whole lifecycle: requirements → build → deploy → iterate, and I communicate clearly with both technical and non-technical stakeholders.

What you can expect from me:

- Strong backend fundamentals (PHP, APIs, MySQL schema design, performance tuning)
- Solid front-end execution (modern HTML/CSS/JS, clean UI, responsive layouts)
- Real-world deployment experience (NGINX/Linux hosting, monitoring, reliability mindset)
- A “ship it” culture—moving from idea to working product quickly and safely

If helpful, I can share a short portfolio walkthrough showing systems I've built and the problems they solved. I'd love to learn what success looks like in the first 60–90 days for this role and see if there's a strong fit.

Thank you,

Kevin M. Richards
